

TECHNICAL DATA SHEET

Relaxing Honeysuckle – Mist Fragrance

Product name: Relaxing Honeysuckle – Mist Fragrance

Olfactory classification:

Honeysuckle Relaxation Fragrance Oil belongs to the floral–aromatic fragrance family, characterized by a calming, soft, and warm profile. The composition combines fresh herbal and floral notes with a soft gourmand–musky base that contributes to relaxation and sensory balance.

Fragrance oil description:

The composition is delicate, balanced, and soothing, with a medium intensity and soft diffusion. The fragrance profile is floral, gently herbal, and warm, with a pronounced effect of relaxation and comfort. The opening is formed through a blend of lavender, verbena, and rose. Lavender provides a soft aromatic and calming note, verbena introduces a fresh citrus nuance, while rose contributes elegant floral softness, creating a harmonious initial impression.

In the heart of the composition, a rich floral bouquet develops, dominated by linden blossom, honeysuckle, and orange blossom. Linden blossom provides a soft and calming floral note, honeysuckle introduces a sweet and pleasant aroma, while orange blossom contributes brightness and freshness. Together, these notes create a stable and rounded fragrance core with a pronounced relaxing effect.

The base structure is founded on honey, tonka bean, and musk. Honey provides warm and subtly gourmand sweetness, tonka bean contributes depth and a delicate spicy nuance, while musk ensures softness and long-lasting performance. The dry-down is warm, enveloping, and comforting, with a pronounced sensation of coziness and calmness.

The dominant accords of this composition include floral soft, aromatic fresh, honeyed sweet, and musky soft facets, which together create a gentle and harmonious fragrance profile. The floral and aromatic aspects remain dominant, while the base contributes stability and a prolonged relaxing effect.

TECHNICAL DATA SHEET

Application:

Honeysuckle Relaxation Fragrance Oil is intended for use in textile and pillow sprays, as well as room mist formulations. The recommended concentration in pillow and textile spray formulations is approximately 3%, combined with a demineralized water base (approximately 95%). The addition of a preservative at around 2% is recommended to protect the formulation from microbiological contamination, with appropriate adjustment of the remaining components.

For optimal homogenization and transparency, the recommended mixing order is: fragrance oil → preservative → water, followed by gentle shaking before use.

Maximum permitted concentrations should be verified according to IFRA Category 10B guidelines. The fragrance demonstrates good stability in water-based systems and provides a long-lasting, soft, and calming sensory effect.
